

SKILL LAB

Training programme at Dr.Somervell Memorial CSI Medical college focuses on enhancing clinical skills for both UG and PG students to attain comprehensive competency of appropriate level to solve clinical problems and provide eminent medical and health care.

The students learn hands-on clinical skills in a structured step manner in small groups on standardised patients, models, mannequins. They are also inculcated to achieve competency in clinical skills, diagnostic reasoning and emphasizing approaches thus providing health care with compassion, communicating appropriately and providing leadership to the health care team. A small group skill performance allows close monitoring of students and objective assessment of skill acquisition.

The plan identifies management and organization, capacity, quality, innovation of capability, development and has proven to be an effective tool for critical thinking and team oriented behavior throughout the medical training.

Dr. Somervell Memorial CSI Medical College and Hospital has created a clinical skill lab for UG and PG students to acquire the essential skills. It is well equipped with clinical skill demonstrators, instruments, mannequins and devices to learn techniques and procedures. Faculty members are trained by KUHS as well as college organized workshops. All departments are utilizing the skill lab in a scheduled manner. We are in the phase of advancing the skill lab facility which enables the students to acquire and improvise their clinical skills. Skill lab training has been proved advantageous for the effective and safe management of patients prior to facing the real patient population.
